

## Milestone 7

# DR-MATCH

DR-MATCH is a public website that allows anyone to search its database for nearest doctors, see recommendations, specialties and more. It is integrated with live location of doctors using google map API.

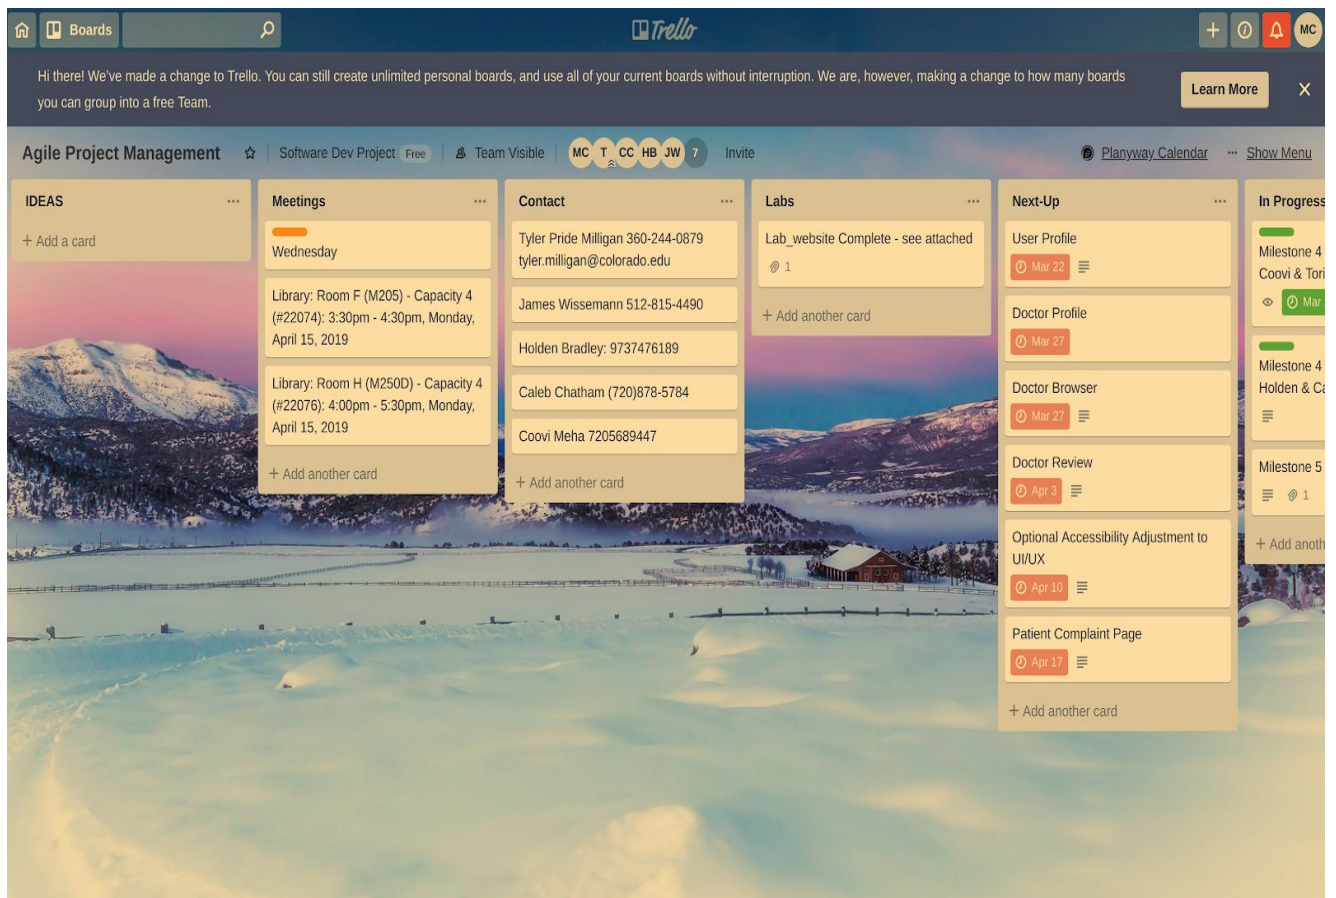

## Designers:

Coovi Meha  
Victoria Orta  
Tyler Miligan  
James Wissemann  
Holden Bradley  
Caleb Chatham

Before running code on computer, go to file where these are all downloaded and run "npm install" in terminal then wait for npm files to download. Once this is complete, use "npm start" to run server locally at localhost/3000.

### Deployment:

We worked to deploy the app over heroku with okta as the login portal, but ran into problems with integrating the login portal. In order to use the login

portal, you must run the app on a local server using the directions described in the github README file.

More specific directions are as follows:

1. Create folder to hold all downloaded files from github.
2. Download the following files from the github repo into new folder:
  - a. bin
  - b. routes
  - c. views
  - d. app.js
  - e. package.json
  - f. package-lock.json
3. Run the following commands once you've navigated to the folder with all the files:
  - a. `npm install express-generator@4.16.0`
  - b. `express --view pug login-portal`
  - c. `npm install`
4. Then run:
  - a. `npm install express-session@1.15.6`
  - b. `npm install @okta/oida-middleware@0.1.3`
  - c. `npm install @okta/okta-sdk-nodejs@1.1.0`
5. Lastly, use `npm start` then go to `localhost:3000` in your browser

To access the project online, the url is though please don't click on the login/logout tab at the top. This isn't functional online.

<https://doctor-details-boulder.herokuapp.com/>.

## **Repo Organization**

All of the relevant files are within the Final-project folder.
